RE: PARKER, R. E.

The medical records, work history, physical exam, and chest radiograph were reviewed.

CHEST:

There are increased parenchymal opacities throughout all six lung zones consistent with ILO classification s/p, 1/0. The cardiac silhouette and mediastinal contours are unremarkable.

IMPRESSION:

On the basis of the medical history review, which is inclusive of a significant occupational exposure to silica dust, physical exam and the chest radiograph, the diagnosis of silicosis is established within a reasonable degree of medical certainty.

George H. Martindale, M.D.
